ZEXVRO — Team Onboarding

What we ship · Three surfaces · Future dev plan · Ownership · Pricing

unified Web3 PaaS on Stellar

One platform. Five services. Stellar rails.

We are not five apps sharing a shell — we are one control plane services plug into.

One identity

One Cognito session every service accepts — no per-app tokens.

One workspace + ledger

Every team gets a workspace and one ZCR credits balance.

One control plane

Sidebar, services, docs, agent and landing all read the same Service Registry.

5	1	3	Mainnet	3rd place
services	credits ledger	founders	live · NFTo	Stellar Garage Pune

- Read context.md → 'Why stable = unified' for the evidence (4 API origins, ~20 hardcoded service-catalog copies).
- North star: Vercel/Cloudflare clarity on Stellar rails.

Three surfaces — one funnel

Learn → Build → Earn. Every ZEXVRO user sits in exactly one of these.

SURFACE 01

Labs

labs.zexvro.in

- Learn & Practice Lab
- Interactive Web3 + Web2 courses, sandbox projects, guided tracks
- SPPU bootcamp partner platform
- Feeds learners into the Console

REVENUE MODEL

FREE — only serious certifications are paid

Owner · curriculum

SURFACE 02

Console

console.zexvro.in

- Developer infrastructure — the control plane
- Run the five services per workspace
- Manage, monitor, audit
- Pay with credits

REVENUE MODEL

CREDITS (ZCR) — metered usage

Owner · platform core

SURFACE 03

Zer0

console.zexvro.in/zer0

- Business money rails
- Private payroll / business payments on the privacy pool
- Stealth, proofs, settlement
- Companion product on the console

REVENUE MODEL

SUBSCRIPTION + per-payout volume

Owner · Paris (Zer0)

Labs — learn to build on Web3

The free top of the funnel. Turn curious people into builders.

- Interactive, hands-on courses — not lecture videos.
- Web3 blocks: Stellar/Soroban, wallets, contracts, x402.
- Web2 blocks: APIs, auth, CLI, CI/CD — the pre-Web3 gaps.
- Sandbox + practice environments with live verification.
- SPPU bootcamp already runs here.
- Graded tracks nudge learners onto the Console to ship.

- Open work: course scaffolding, sandbox infra, SPPU track, certification flow.

Revenue model

Keep learning free. Charge only for serious, verifiable certifications (a Web3 dev cert) — never for practice access.

Owner

To assign. Needs a curriculum lead + content/devrel helpers.

Console — the developer control plane

Where developers deploy, run, monitor and pay for ZEXVRO services.

- One logged-in identity + workspace + credentials.
- Run the five services: NFTo, DEDSEC, REQWID, Morph, Zer0 admin.
- Service Registry drives sidebar, Services, docs, agent KB.
- Unified API gateway + one audit + one /health per service.
- One ZCR ledger bills NFTo / DEDSEC / Zer0 settle.

- Open work: Service Registry refactor, API Gateway, credits metering, workspace provisioning.

Revenue model

Credits (ZCR). Developers buy credit packs and spend per service. One ledger, volume discounts as usage grows.

Owner

Platform core (Paris · Rushi · Nabil). New members: Registry, gateway, credits.

Console · Zer0 — business payroll & private payments

Zer0 is the product inside the console that actually moves business money.

- Zero-knowledge privacy for business payments.
- Payroll runs: people, pay party, history, proofs, stealth.
- Businesses get Web3 rails without exposing sensitive tx details.
- Product UI complete (2026-07-17).
- Settle E2E, compliance view-keys and mainnet policy remain.
- Cross-sell wedge: NFTo indie studios → Zer0 for their payouts.

Revenue model

Business subscription + a per-payout volume fee (or per payroll run). Built for finance teams, not consumers.

Owner

Paris (Zer0). Weigh in on treasury keys, compliance.

- Open work: settle E2E, compliance view-keys, treasury ops keys, payroll-run pricing.

Five services — one platform

Always name consistently. Status is honest to context.md.

Service	What it does	Status	Owner
Zer0	Zero-knowledge privacy for business payments	**Product UI complete**	Paris
Morph	Transformation agent for Web2 → Web3 migration	**CLI built · wiring next**	Paris + Morph
REQWID	Human vs agent classification for product flows	**Partial**	Rushi
NFTo	Deploy & sell NFTs without chain complexity	**Mainnet live**	Nabil + Paris
DEDSEC	x402 paid access gateway for APIs & compute	**v1 · expansion planned**	Nabil

Out of MVP: A2A Trade. New features are proposed until the team accepts them.

In production today

Zer0 and NFTo have mainnet-grade product UI.

Zer0

Zero-knowledge privacy pool for business payments. Multi-screen suite: dashboard, people, pay party, history, proofs, stealth, settings. Owned by Paris.

STATUS · Product UI complete

Owner · Paris

NFTo

NFT service — deploy and sell NFTs without chain complexity. Mainnet WASM + App Runner + atomic USDC checkout (SEP-41). Nabil builds the API/chain, Paris the dashboard.

STATUS · Mainnet live

Owner · Nabil + Paris

Dig deeper in context.md → Service Map · #1 Zer0 and #4 NFTo.

In progress & next

Morph, REQWID and DEDSEC are not done — don't overclaim.

Morph

Transformation agent — inspect a repo, explain Web2→Web3 migration, deploy through CLI + web. CLI built with Python/Typer, SQLite memory, tool registry.

STATUS · CLI built · wiring next

Owner · Paris + Morph track

REQWID

Dual-channel capability issuer — proves human vs agent without default-denying agents. Owned by Rushi. Nature of feelings: honest, no perfect detection.

STATUS · Partial

Owner · Rushi

DEDSEC

x402 paid-access gateway for APIs & compute. Economic firewall in front of expensive APIs; v1 is GET/HEAD routes.

STATUS · v1 GET/HEAD · expansion planned

Owner · Nabil

Morph · REQWID · DEDSEC growth stays Proposed until the team accepts it.

Pricing philosophy

Credits are the metering layer — but we don't charge everywhere.

One ledger

A single ZCR balance per workspace. Buy packs, spend per service. No fragmented billing.

Not everywhere

Pricing is not mandatory. Where we win on distribution (Labs), stay free.

Freemium wedge

One service free; pay for the rest. Easy in, grow into credits.

Credit → what it buys

- 1 ZCR = a metered unit of usage (a mint, a verified request, a payout, a migration task).
- Price per unit per service; volume discounts as usage grows.
- Free tiers stay generous for acquisition; credits kick in at scale.

This is a proposal to kick the team conversation — validate numbers with real users before locking.

Pricing by surface

Who pays, and the model per surface.

Surface	Who pays	Model	Notes
Labs	Learners	Free	Revenue only from serious, verifiable certifications.
Console	Developers	Credits (ZCR)	Buy credit packs; metered per service; volume discounts.
Console · Zer0	Businesses	Subscription + per payout	Built for finance teams; per-run or volume fee.

Default rule

Free for anything that grows reach (learn, practice, evaluate). Charge where real cost or real value accrues (compute, money movement, certifications).

Pricing by service (proposal)

Per-service unit. Numbers are direction, not final.

Service	Model	Proposed pricing
Zer0	Business plan	Workspace subscription + per-payout volume fee (per payroll run).
Morph	Credits	Free during evaluation; credits per migration task.
REQWID	Free tier + credits	Generous free verifications/day; credits beyond.
NFTo	Credits	Free tier mints; then credits per mint / per collection (USDC-backed checkout).
DEDSEC	Pay-per-request	Coins/credits per verified x402 request; provider sets price.

Validate with users and founders before these become policy. NFTo checkout stays SEP-41 atomic.

Future dev plan — Unified PaaS

Stability = unifying the platform, not fixing five apps. Matches the funding plan.

Phase	Theme	Key work
A · weeks 1–3	Unify the spine	Service Registry · unified API gateway · one identity/session · green tests (fix 12).
B · weeks 4–6	Unify value	One credits ledger · workspace provisioning · audit + health plane · onboard NFTo/DEDSEC.
C · weeks 7–10	Agentic + delivery	Morph + REQWID as modules · CI/CD on the repo · cost discipline.
D · weeks 10+	Programs + team + client	Startup programs · marketing refresh · hires · first client (SPPU anchor).

Reading: docs/roadmap-unified-paas.md (A–D) + docs/funding-and-infra-plan.md (costs).

Assigning work — who owns what

Three founders keep ownership. New teammates pick up from an owner.

Area	Owner	Notable open work
Zer0 (product / privacy)	Paris	Settle E2E, compliance view-keys, treasury ops.
Morph	Paris + Morph track	WS memory, agentic wiring, dashboard, demo.
REQWID	Rushi	Public host gate.zexvro.in, SDK distribution.
NFTo (API / chain)	Nabil + Paris (UI)	Onboard to credits ledger, smoke mainnet.
DEDSEC	Nabil	POST/stream gates, rate cards.
Credits / RBAC / workspace	Nabil	Credits ledger (B1), workspace provisioning (B2).
Platform / control plane	Paris · Rushi · Nabil	Service Registry, API Gateway, audit plane.

Quick wins for new members: Registry refactor, test fixes, service READMEs, marketing copy, devrel, curriculum.

Getting started

A ten-minute onboarding to be productive.

- Read, in order: AGENTS.md → context.md → design.md → memory.md.
- Know the three surfaces (Labs / Console / Console·Zer0) and the five services.
- Code layout: frontend/ (dashboard) · services/{nft-service, agent-auth, depin, transformation-agent} · landing/zexvro/.
- Verify per service: cd <service> && npm run lint && npm test && npm run build.
- Defaults: commit code + a memory.md note together · don't take a ticket without coordination · no secrets / .env in commits.
- Log meaningful work in memory.md and update context.md statuses.

New here? Ask Paris, Rushi or Nabil for a pick-up item — Registry refactor and curriculum are the easiest first tasks.
